### ABSTRACT

An apparatus for storage of disk-shaped data storage media. The apparatus includes a flat housing and a coupling member for releasably connecting the housing to a carrier. The housing has a slot opening via which a reception space for the data storage medium is accessible, wherein the coupling member can be inserted into the housing via the slot opening and is releasably connected, in particular latched, to the flat housing in the inserted state, thereby substantially enclosing the medium within the reception space.
